Plan by A.S.H. and J.C.W.

(fig. 83)

Visited 15.7.56

Description. The site is on gently sloping arable land at a little over 200ft. (61.0m) OD. The cairn was removed about 1854,¹ but its last remains are still visible though obscured by field-gathered stones and a drainage ditch dug across the N side. The cairn has been very large; Childe suggests a diameter of 110ft. which is certainly a minimum and there are indications that it was (33.6m) even larger, about 130ft. across. (39.8m)

A number of slabs remain amongst the debris to the NE of the centre. The most conspicuous is a huge stone aligned E-W which stands 6ft. high and is (1.8m) 10ft. long, and has recently had its S face blasted away. At right angles to it (3.0m) on the E is a smaller slab 2ft. high. These two stones appear to represent (0.6m) part of a very large chamber, but due to the severe robbing of the centre of the cairn it is unlikely any other substantial slabs remain. To the SE there is a greater depth of cairn material and four stones all the same height are visible, suggesting there was an entrance on this side. One slab leads towards the cairn edge, and beyond it is a pair of slabs, their ends 1ft. 4in. apart, which (406mm) have the appearance of portal stones. A lower slab leans against the inner face of the SE portal stone, and a displaced slab lies further w. The portal stones are 26ft. from the NE edge of the cairn. (8.0m)

Finds

The 6in. OS map records 'human remains found here 1854'.

Millcraig

(2)

The remains of the cairn are generally as described by Henshall. It is now virtually impossible to trace the perimeter but it is possible that it had a diameter of c 53 m. In the northern half of the cairn area there is a large stony circular bank composed mainly of small stones. It is c 20.0 m in diameter and varies in width from 5.0 m on the north side to c 10.0 m in the south side with a max. height of 1.5 m in the south side. This circular bank is broken on its north east side and its west side by modern gaps and inside the north-east gap on its south side are the slabs described above. There are five upright stones and one fallen stone, a seventh stone is just visible protruding from the ground.
